

Given,

3-Layer fully Connected Network

With Dimensions $[784 \rightarrow 256 \rightarrow 128 \rightarrow 10]$

① No. of MAC's for each layer:

No. of. MAC's per layer = No. of. Neurons $\times$ No. of. inputs
in the layer for each neuron
in the layer.

$$\begin{aligned}\text{No. of. MAC's for 1st layer} &= 256 \times 784 \\ &= 200704\end{aligned}$$

$$\text{No. of. MAC's for 2nd layer} = 128 \times 256 = 32768$$

$$\text{No. of. MAC's for 3rd layer} = 10 \times 128 = 1280$$

② Total MAC's for One - forward pass:-

$$\begin{aligned}\text{Total MAC's for} &= \text{Sum of MAC's in all layers} \\ \text{1 - forward pass} & \\ &= \text{1st layer} + \text{2nd layer} + \text{3rd layer} \\ &= 200704 + 32768 + 1280 \\ &= 234752\end{aligned}$$

③ Total no. of. Trainable parameters [Weights only, No Bias]

Total No. of. Trainable Parameters = Sum of all layers (inputs $\times$ outputs)

Some as MAC's as no-bias

$$= 234,752 \text{ weights}$$

④ Total weight memory in Bytes [FP32] :-

In FP32, each weight = 4 bytes

$$= \text{Total parameters} \times \text{Bytes/weight}$$

$$= 234,752 \times 4 = 939,008 \text{ bytes}$$

⑤ Total Activation memory = Total no. of. neurons in network $\times 4$

$$= [784 + 256 + 128 + 10] \times 4$$

$$= 4712 \text{ Bytes}$$

⑥

$$\text{Arithmetic Intensity} = \frac{2 \times \text{Total MAC's}}{(\text{Weight bytes} + \text{Activation bytes})}$$

(Weight bytes + Activation bytes)

$$= \frac{2 \times 234752}{[939008 + 4712]}$$

$$= 0.4975 \text{ flop/byte}$$

$$= 0.4975 \text{ flop/byte}$$

Total Weight memory in bytes [4925]

In 4925, each weight = 4 bytes

Total Parameters & Bytes/Weight

$$= 234752 \times 4 = 939008 \text{ bytes}$$

Total Activation memory = 4712 bytes

in network of 4

$$[184 + 525 + 150 + 10] =$$

4712 bytes
